

HIV and AIDS in Adolescents

Introduction

Adolescents account for about 5 per cent of all people living with HIV and about 11 per cent of new adult HIV infections. Globally, adolescents 10-19 years account for about 5 per cent of all people living with HIV. In 2020, about 54% of adolescents living with HIV globally, received antiretroviral treatment. Antiretroviral treatment coverage was 53% and 55% among adolescent girls and boys, respectively. In order to reach the 95-95-95 targets by 2025, there is an urgent need to ramp up treatment efforts among adolescents.
